1-Minute Executive Takeaway

Key Finding: Proves LLM-based MCQ generation is pedagogically feasible for institutional texts, but highlights the necessity of deterministic verification and grounding.

Core Research Objective

To investigate automated multiple-choice question generation and multi-dimensional LLM evaluation systems grounded in institutional regulatory documents (university resolutions).

Methodology & Architecture

Constructed an automated question generation pipeline using large language models conditioned on official administrative texts. Employed automated LLM evaluators to score questions across factual consistency, relevance, and distractor plausibility.

Key Empirical Findings & Evidence

Demonstrated that instruction-tuned LLMs can reliably generate multiple-choice questions from institutional corpora, but naive generation frequently introduces subtle distractor ambiguities or hallucinations without strict grounding constraints.

Direct Relevance to Our Kwiz Paper

Directly cited in Section 1 and Section 2.1 as foundational precedent establishing LLM-based MCQ generation. We extend Mucciaccia et al. by shifting from administrative university texts to programming-specific code generation with deterministic Python AST syntax compilation and Moodle Question Bank integration.
